1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Murayama et al EP 1 022 726 alone or in combination with Meguro et al EP 1 207 522.

Murayama et al disclose a magnetic recording medium comprising a non magnetic layer comprising non magnetic powder and a binder and a magnetic layer comprising ferromagnetic powder and a binder. The magnetic layer thickness range encompasses the range claimed in claims 1, 2, and 8 [0123], the mean major axis length or mean plate diameter overlaps the ranges claimed in claims 1, 2, 10 [0105], the coercivity is in the range claimed in claims 1, 2, 9 [0160], and the binder taught is a polyurethane binder with a Tg range that encompasses the claimed ranges [0061].

The polyurethane resins taught are within the claim limitations of claims 1-7 see [0012], [0123], page 6 lines 1-15, and [0060] - [0063].

Therefore it would have been obvious to one of ordinary skill in the art to vary these results effective variables to optimize performance of the media.

It was old in the magnetic recording art at the time of the invention to use smaller size ferromagnetic particles when the media was to be used with a MR head. See Meguro et al EP 1 207 522 especially at [0092]. Therefore it would have been obvious to one of ordinary skill in the art to employ smaller size magnetic particles in a range of 5-40 nm for this purpose.
